Application examples

Bonding with high adhesion

Good adhesion to metal, plastic, glass and many other materials → DELO-GUM 3697

Use up to +300°C

Very high temperature resistance → DELO-GUM 3699

Casting applications

Good flow behavior, self-leveling
→ DELO-GUM CR3010

Bonding, sealing, casting in electronics

- → DELO-GUM CR3010
- → DELO-GUM SJ3097

Sealing of large gaps

High viscosity, steady
→ DELO-GUM SJ3099

- → DELO-GUM 3699

Product description

DELO-GUM products are one-component, solvent-free adhesives and sealants on the basis of silicone rubber.

Standard temperature range

our products react to temperatures.

DELO-GUM products are normally used in a temperature range of -50 °C to +180 °C (resp. +300 °C, see special features of product DELO-GUM products are used as permanently flexible adhesives "resistant to high temperatures").

change permanently, in particular at high temperatures. Therefore, weathering and aging. Important application areas can be found in it has to be checked before each use whether a certain adhesive is electronics and electrical engineering. Applications in these areas suitable for the temperatures in the required area of application. are for example the sealing of microswitches and cable bushings

Processing

The products are normally delivered ready for use. They are applied directly from the container or using dispensing units.

Curing

Curing proceeds at room temperature under the influence of air fluctuations. For decades DELO-GUM silicones have proven to be humidity. Increased humidity concentration accelerates curing. efficient for the bonding of glass to metal and glass to plastic in The reaction proceeds very fast - skin is formed within 5 to glass and lamp construction. 20 minutes. Therefore, the components should be joined without interruption. Curing proceeds from outside to inside. 2 mm of adhesive are completely cured in 24 hours.

Surface pretreatment

dust, oil, grease, separating agents and other contaminations. Engineering Department. For cleaning, we recommend using cleaning agents from the DELOTHEN series.

After cleaning, the adhesion of the adhesive can be further enhanced by sand blasting or grinding the surface.

The long-term behavior of the bonding is improved by the DELO-SACO method.

The silicone primer DELO-PRE 3003 should be used on rigid materials under the following conditions:

- Porous materials
- High thermal stresses
- High mechanical stresses
- Strong climatic fluctuations
- Strong humidity influence

On flexible materials, such as rubber or plastic, the primer layer hardly resists deformations and can be lifted off. The primer is applied thinly by brushing, spraying or dipping on the precleaned surface. After an evaporation time of 30 minutes, the silicone is applied.

Storage life

DELO-GUM CR3010: 6 months. All other types: 1 year. After delivery, in the unopened original container at room temperature.

Use

and sealants, and as fixing and casting compounds. Their special Many product properties depend on the temperature and can advantages are their high resistance to elevated temperatures, Please see the Technical Data Sheet for more information on how as well as the casting of electronic assembly groups in vehicle electronics, such as door closer heatings. In electronics, products that decompose amines and oximes are preferred in most cases. In tool construction and mechanical engineering, DELO-GUM products are used for bonding and sealing of media-bearing hollows, such as oil pans, cooling liquid containers, etc.

DELO-GUM adhesives are excellent for the tension-equalizing bonding of dissimilar materials, especially in case of temperature

Further information

More type-specific properties are included in the Technical Data Sheets, Material Safety Data Sheets and Instructions for Use. For application tests and any question you might have regarding To achieve optimum bond strength, the surfaces must be free from the use of DELO products, please do not hesitate to contact our
